                                                                               The present sequence is the maize leafy cotyledon 1 transcriptional activator, LEC1. This sequence is a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the nucleilus integument, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1 transpenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Soybean; leafy cotyledon 1 transcriptional activator; LEC1; apomixis; selectable marker; transgenic plant; transgenic seed; HAP3.

```
the present sequence is a HAP3-type CCAAT-box binding protein. Cartivator, LEC1. This sequence is a HAP3-type CCAAT-box binding protein. EC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When appmixis occurs, i.e. the replacement of sexual reproduction by asexual reproduction, c.e. the megaspore mother cell would trigger embryo formation from anternal tissues only. This results in the production of seeds identical to the parent Using LEC1, transgenic high yielding seeds could be concluded. The addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.

Note: this sequence is different from that of AAY36220, ewen though they are both encoded by the same nucleotide sequence (AAAZ7460). The AAY36220 sequence has 18 stop codons distributed throughout the CDS, while the protein of AAY36224 has the stop codons comitted.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                   The present sequence is the soybean leafy cotyledon I transcriptional activator, LEC1. This sequence is a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the nucleilus integument, or cell specific expression in the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be ceveloped. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.

Note: this sequence is different from that of AAY96224, even though they are both encoded by the same nucleotide sequence (AAA27460). The AAY96220 sequence has 18 stop codons distributed throughout the CDS, while the protein of AAY96224 has the stop codons omitted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4

```
The present sequence is the soybean leafy cotyledon 1 transcriptional activator, LEC1. This sequence is a HAP3-type CCAAT-box binding protein. LEC1 expression intitates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the nuclellus integument, or cell specific expression in the magaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.
Soybean; leafy cotyledon 1 transcriptional activator; LEC1; apomixis; selectable marker; transgenic plant; transgenic seed; HAP3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            130 DARGVGLVPGAAPSRGGDHHPHSMSPAAMLKSRGPVSGAAMLPHHHHHHHDMQMHAAMYGG 189

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -----gf----hgpshglpppgpygy----gmldqsmvmgggryyq-ngssgqdes 185
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LEC1 polypeptide is encoded by the leafy cotyledon-1 (LEC1) gene (see AAV61022-24) of Arabidopsis thaliana. Full-length LEC1 polypeptide can act as a subunit of a protein capable of acting as a transcription factor in plant cells. The LEC1 gene is embryo-specific and can be used to modulate development (claimed) of embryos or other organs in plants. Inhibiting expression can be useful e.g. in weed control (by transferring an inhibitory sequence to a weedy species and allowing it to be transmitted through sexual crosses) or to produce fruit with samil and non-viable seed. Enhanced expression of LEC1 can be used to increase storage protein content in plant tissues to improve nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              76 YISPITGEANERCOREORKTITAEDVLWAMSRLGFDDYVEPLGAYLHRYREFEGDARGVG 135

```
The present sequence represents a Leafy Cotyledon 1 (LEC1) polypeptide. LEC1 genes are thought to play a central role in late embryogenesis, in specifying cotyledon identity during embryo development. LEC1 polypeptides may act as transcription factors. LEC1 polynucleotides are useful for modulating seed development and for inducing ecotopic development of embryonic tissue in a plant. In both cases, the LEC1 polynucleotide is introduced into the plant through a sexual cross and is co-expressed in a natisense orientation with a second heterologous polynucleotide selected from AP2 and RAP2 genes of Arabidopsis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      LECT polynucleotide is also useful for targeting expression in a seed, and for preparing expression cassettes for suppression to enhancing endogenous LECT gene expression, which is useful in weed control or for improving nutritional value of plant tissue respectively. LECT polypeptides and polynucleotides are especially used for increasing or decreasing storage protein content in cotyledons or leaves. LECT also increases reproductive tissue mass, e.g., increases fruit size, seed mass, its protein or its oil.
                                                                                                                                                                                                                                      Leafy cotyledon 1 gene; LEC1 gene; embryogenesis; cotyledon identity; embryo development; transcription factor; seed development; ecotopic development; embryonic plant tissue; weed control; nutritional value; storage protein; cotyledon; seed; reproductive tissue mass; fruit size; seed mass.

Veronia mespilifolia LEC1.

-----GDARGVGLVPGAAPSRGGDHHPHSM-----SPAAMLKSRGPVSGAAMLPH 173

```
The present sequence is the wheat leafy cotyledon 1 transcriptional activator, LEC1. This sequence is a HAP3-type CCAAT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. expression in the nuclellus integument, or cell specific expression in the nuclellus integument, or cell specific expression in the muchallus integument, or cell specific expression in the magaspore mother cell would trigger embryo formation from maternal parent. Using LEC1, transgenic high yielding seeds identical to the addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.

Leafy cotyledon 1 transcriptional activator; LEC1; apomixis; selectable marker; transgenic plant; transgenic seed; HAP3.

Veronia mespilifolia.

WO200028058-A2.

```
The present sequence is the leafy cotyledon I transcriptional activator, LEC1 of Veronia mespilifolia. This sequence is a HAP3-type CCAAT-box bidding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. During abomixis, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the nuclellus integument, or cell specific expression in the megaspore mother cell triggers embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing
                                                                                                                                                                                                                                                                                                                                                                                                   particularly Leafy cotyledon 1 transcriptional activator, useful for
inducing somatic embryogenesis or apomixis in a plant cell

Ϊ,
The present sequence is the leafy cotyledon 1 transcriptional activator, LEC1 of Argemone mexicana. This sequence is a HAP3-type CCAANT-box binding protein. LEC1 expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. During apomixis, i.e. the replacement of sexual reproduction by asexual reproduction, LEC1 expression in the muchallus integument, or cell specific expression in the medaspore mother cell triggers embryo formation from maternal Lissues only. This results in the production of seeds identical to the parent. Using LEC1, transgenic high yielding seeds could be developed. In addition, LEC1 could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           51 MRRVLPAHAKISDDAKETIQECVSEYISFITGEANERCQREQRKTITAEDVLWAMSRLGF 110

activator, LEGI. This sequence is a HAP3-type CCAAT-box binding protein. Expression initiates the formation of embryo-like structures and the expression initiates the formation of embryo-like structures and the replacement of accovery of transformants. When apomitis occurs, i.e. the replacement of sexual reproduction by assawal reproduction, LECI the megaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the addition, LECI could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants.
                            present sequence is the soybean leafy cotyledon 1 transcriptional

New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide

Claim 8; Page 387; 747pp; English.

The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such

```
transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mabogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, belix-loop-helix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain cys2H1s2, CCAAT box elements and MYB.

The present sequence is the leafy cotyledon 1 transcriptional activator, CC consensus sequence from Arabidopsis. This sequence is a HAP3-type CCAAT-box binding protein. LECI expression initiates the formation of embryo-like structures and improves growth and recovery of transformants. When apomixis occurs, i.e. the replacement of sexual reproduction, LECI expression in the nuclellus reproduction by assexual reproduction. LECI expression in the nuclellus conducting to seeds in the medaspore mother cell would trigger embryo formation from maternal tissues only. This results in the production of seeds identical to the parent. Using LECI, transgenic high yielding seeds could be developed. In addition, LECI could be used for positive selection of a transformed cell (transgenic plant), for increasing transformation efficiency and for increasing recovery of regenerated plants. The present sequence (AAY96223).

/note="Vector: plasmid pBK-CMV; Site_1: EcoRI; Site_2:
XhoI; mRNA was made from developing caryopsis (3.-15.DAP)
of Spring barley variety 'Barke', a high quality malting
variety. Cloning sites: EcoRI (5'-end of cDNA) and XhoI
(3'-end of cDNA). NOTE: Due to a cloning artefact caused
by the kit, in most cases the EcoRI site is NOT present,
as well as the EcoRI adapter. Average insert size is 1 kb
Sequence trimming: Vector sequences and sequence ends were
trimmed from the 5'-and 3'-end until a 50 bp window
contains less than two ambiguities. The maximum length was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Sperimatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; Pooldeae; Triticeae; Hordeum.

/note="Vector: plasmid pBK-CMV; Site_1: ECORI; Site_2: XhoI; mRNA was made from developing caryopsis (3.-15.DAP) of spring barley variety 'Barke', a high quality malting variety. Cloning sites: ECORI (5'-end of CDNA) and XhoI (3'-end of CDNA). NOTE: Due to a cloning artefact caused by the kit, in most cases the ECORI site is NOT present, as well as the ECORI adapter. Average insert size is 1 kb Sequence trimming: Vector sequences and sequence ends were trimmed from the 5'-and 3'-end until a 50 bp window
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; Pooideae

synthesized from mRNA using a primer consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the ECORI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. Tissue culture and library construction were performed by Francoise Thibaud-Nissen and Anu Khana (Lila Vodkin lab, 110 c 131 g 90 t

/ncte="Vector: psport; site\_1: Not I; Site\_2: Sal I; This cond library was constructed from mRNA isolated from very young cotyledons (20-50mgs fresh weight) of greenhouse grown plants. The library was prepared using the Life Technologies psuperscript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly(dT) sequence with a Not I restriction site. Sal I linker adapters were ligated to the blunt-ended cDNA fragments followed by Not I digestion. The cDNA fragments were directionally cloned into the Not I sal I restriction site of the pspoRTI vector. The ligated cDNA fragments were transformed into E.coli Electromax DHIOB host cells. This library was constructed by Dr. Paul Keim and Dr. Virinia Coryell." /tissue\_type="very young cotyledons of greenhouse grown www.genomesystems.com 0.00 /clone="GENOME SYSTEMS CLONE ID: Gm-c1029-97" /clone\_lib="Gm-c1029" 104 t info@genomesystems.com web site: Insert Length: 1007 Std Error: /organism="Glycine max" High quality sequence stop: 455 Location/Qualifiers /db\_xref="taxon:3847 144 g /lab\_host="DH10B" 147 c Source BASE COUNT FEATURES ORIGIN

/ Additions.— United The Page 11 SK+; Site_1: EcoRI; Site_2: AhoI; The CDNA library was constructed from mRNA isolated from mature seed pods of greenhouse grown plants prior to senescence for the cultivar RPI. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended CDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI. XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoRL). This
                                                                                                                                                                                                                                                                                                                                        1 (bases 1 to 470)

XhoI; This cDNA library was constructed from mRNA isolated
from cotyledons of 3- and 7-day-old Williams seedlings
which were propagated on paper towels with distilled
water. The cotyledons were flash-frozen in liquid
nitrogen, then lyophilized for 72 hours. Unequal amounts
of mRNA was used for cDNA synthesis. Stratagene's cDNA
Synthesize the cDNA. First- stranded synthesis was
performed with 5-methyl dCTP, hence the ligated cDNA was
hemimethylated. A modification of Stratagene's
first-strand synthesis primer was used. An anchor
nucleotide (V-A, C, or G) was added to the 3' end of the
primer [GAGAGAGAGAGACTAGTCTCGAG(T)] is anchor
the county of the contract of the contr

subsequently phosphorylated. The XhoI suber within the first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500 bp cutoff, using Gibrobalt Life Technologies' CDNA Size Fractionation column. The column cluent was then ligated into Stratagene's paluescript(tm) II XR Predigested vector (pRluescript II SK(+) that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene); 97% of the plasmids with CDNA inserts, based on size (n=30). This library was constructed by Dr. Paul Keim and Dr. Virginia CDTypell.

Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a ANNI restriction site. EcoRI adapters were ligated to the CDNA fragments followed by Xhoi digestion. The CDNA fragments directionally cloned into the

XhoI: This CDNA library was constructed from mRNA isolated
from cotyledons of 3- and 7-day-old Williams seedlings
which were propagated on paper towels with distilled
mitrogen, then lyophilized for 72 hours. Unequal amounts
of mRNA was used for CDNA synthesis. Stratagene's CDNA
Synthexix Kit (catalog number 200401) was used to
synthesize the CDNA. First- stranded synthesis was
performed with 5-methyl GTTP, hence the ligated CDNA was
hemimethylated. A modification of Stratagene's
first-strand synthesis primer was used. An anchor
nucleotide (V-A, C, or G) was added to the 3' end of the
primer [GAGAGAGAGAGAACTAGTCTCGAG(T)18] to anchor
the primer at the 5' end of the poly(A) tract. After
second- strand synthesis, the CDNA ends were filled in
with cloned Pfu DNA, ligated to EcoRi adapters and
subsequently phosphorylated. The KhoI site within the
first-strand synthesis primer was then restricted by
digestion with Aho! all XhoI sites in the CDNA would be
protected by their hemimethylated status. The CDNA
constructs were size-fractionated with a 500 bp cutoff,
using GibcoBR. Life Technologies' CDNA Size Fractionation
column - The column eluent was then ligated inco
                                                                                                                                                                                             (bases 1 to 422)

The library was prepared using the Life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a NotI restrictions site. Sal1 linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The cDNA fragments were directionally cloned into the NotI-Sal1 restriction site of the pSPORT! vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. This library was constructed in the laboratory of Dr. Lila Vodkin by Anu Khanna at the University of Illinois at Urbana-Champaign. e-mail: l-vodkin@uluc.edu"
